1. Executive Summary

ITS – Industrial Technology Solutions is a startup technical services company built on two complementary capabilities: electrical & electronics engineering and machine building & maintenance. Combining both disciplines under one roof positions ITS as a single, accountable technical partner for manufacturing and production facilities that would otherwise coordinate separate electrical and mechanical contractors.

This document brings together the company's mission, service offering, pricing model, organizational structure, brand positioning, client acquisition strategy, and a phased roadmap into one internal reference for the founding team. It is a working draft: use it to align on direction now, and revise it as real client and market feedback comes in.

2. Company Overview

2.1 Mission

To deliver dependable electrical, electronic, and mechanical engineering solutions that keep industrial operations running safely and efficiently.

2.2 Vision

To become the trusted, full-scope technical partner for manufacturing and industrial facilities in our region — recognized for pairing electrical/electronics expertise with mechanical machine capability inside a single accountable team.

2.3 Core Values

- **Reliability** — we show up, deliver on schedule, and stand behind our work.
- **Technical Precision** — engineering-grade standards on every job, no shortcuts.
- **Safety First** — strict adherence to industrial safety practice on every site.
- **Responsiveness** — fast turnaround on maintenance calls and breakdowns.
- **Partnership** — built for long-term client relationships, not one-off jobs.

2.4 Legal Structure

ITS – Industrial Technology Solutions is registered as a sole proprietorship, under this exact legal name.

3. Services Portfolio

ITS operates across two core service lines. Together, they let a single client rely on ITS for both the systems that power their equipment and the machines themselves.

3.1 Electrical & Electronics Industry Solutions

- Industrial control panels & automation systems
- PLC programming & industrial automation
- Custom PCB design & hardware solutions

- Industrial electrical installation and wiring
- Electrical troubleshooting, testing, and preventive maintenance

3.2 Machine Building & Maintenance

- Machine design & build
- Custom machinery & CNC development
- Machine installation and commissioning
- Preventive maintenance programs
- Corrective and breakdown repair services
- Machine retrofitting and upgrades
- Mechanical spare-parts fabrication

Updated to reflect the confirmed offerings from your business card and your addition of machine design & build.

4. Pricing & Revenue Model

ITS pricing is built to capture the value delivered, not just time spent. Three revenue streams work together: fixed project rates for defined builds, monthly maintenance retainers for recurring stability, and premium emergency fees for rapid response.

4.1 Fixed Project Rates (Machine Builds & Upgrades)

For scope-defined project work, ITS quotes a flat fee. Because the risk of scope creep sits with ITS once a price is fixed, pricing must account for that risk upfront.

$$\text{Project Quote} = (\text{Estimated Labor Hours} \times \text{Hourly Rate}) + \text{Materials Cost} + \text{Risk/Overhead Buffer} + \text{Profit Margin}$$

- **Labor Estimate** — total hours required across every team member involved in the job.
- **Materials Cost** — a 10–20% markup on parts/components to cover procurement, handling, and warranty management.
- **Risk/Overhead Buffer** — a 5–10% contingency for unforeseen technical hurdles or delays.
- **Profit Margin** — confirmed target range of 20–30% net margin on top of all other costs.

Always issue a Statement of Work (SOW) alongside every project quote. It defines exactly what's included — and what isn't — so scope changes get billed separately rather than absorbed for free.

4.2 Monthly Maintenance Fees (Preventive Care)

This is the recurring revenue base — the most stable part of the business. Structure it as a tiered Service Level Agreement (SLA) rather than one-off service calls, so clients buy into an ongoing plan instead of calling only once something breaks.

Tier	Focus	Fee Level
Tier 1 – Basic	Remote monitoring, data logging, and priority email support	Low, fixed monthly retainer
Tier 2 – Standard	Tier 1 + one monthly on-site visit (cleaning, sensor calibration, minor adjustments)	Mid-level, fixed monthly retainer
Tier 3 – Comprehensive	Tier 2 + reduced emergency labor rates + priority scheduling	Higher monthly retainer

Set contract terms at 6 or 12 months. That predictability lets ITS plan technician schedules and payroll commitments with confidence.

4.3 Premium Emergency Fees (Rapid Response)

Emergency pricing isn't just an hourly rate — it's an availability fee that prioritizes a client whose production has stopped.

- **Standard Hourly Rate** — the normal billing rate, used as the baseline.
- **Emergency Multiplier** — confirmed at 1.5× for call-outs after standard business hours or on weekends.
- **Dispatch Fee** — a flat show-up fee covering technician and vehicle/tool mobilization, charged regardless of repair duration.

Communicate emergency fees clearly before dispatch — a client under production pressure will gladly pay for the certainty that help is already on the way.

5. Target Market & Clients

Primary segment: manufacturing and production plants, and industrial facilities more broadly.

The core opportunity: most plants currently split electrical/automation work and mechanical/machine work across two separate vendors. ITS's dual capability removes that friction — one point of contact, one team, one accountability chain for both.

Geographic Approach

- Phase 1: build reputation locally with a small number of well-served clients
- Phase 2: expand regionally as capacity and references grow
- Phase 3: pursue larger or multi-site industrial accounts selectively

6. Organizational Structure

ITS's structure is defined by functional outcomes, not just titles — one Leadership Pillar and two Operational Pillars, connected by a cross-trained Bridge role. This lets the team specialize by discipline while staying flexible enough to cover for each other as workload shifts.

6.1 The Leadership Pillar

As founder, the goal is to move from doing the work to directing it. The core responsibility is the “Master Guarantee” — personally overseeing final inspection before any project is handed over, which protects ITS's reputation as the company scales.

6.2 The Operational Pillars

The two Lead Technicians are cross-trained but each owns a primary discipline, with a defined support role in the other whenever workload demands it — so the team is never paying for idle hands.

6.3 The Bridge Role

The most common point of failure in technical services is the gap between electrical and mechanical work — usually where the two sides don't communicate and a project stalls. The Generalist Technician is trained across both disciplines and exists specifically to close that gap: making sure electrical systems fit the mechanical chassis correctly and preventing a “that's not my job” mentality.

Every technician, regardless of role, works from the Standardized Operational Playbooks as the source of truth — not personal preference — so output stays consistent no matter who is on the job.

Role	Primary Focus	Support Role
Lead Engineer / Owner	Client acquisition (sales), strategic planning, and final QA — the “Master Guarantee”	—
Electrical & Electronics Lead Tech	Control panel design, PLC programming, wiring, and sensor integration	Mechanical assembly during high-volume periods
Mechanical Building & Maintenance Lead Tech	Fabrication, machine assembly, hydraulics/pneumatics, and structural repairs	Cable management and device mounting for the electrical team
Generalist Technician (“The Bridge”)	Ensures electrical systems integrate correctly with the mechanical chassis; trained across both disciplines	Fills workflow gaps between the two teams on any project

Why This Structure Works

- **Scalability** — growth means adding another technician to the right pillar, not redesigning the org chart.
- **Accountability** — clear ownership means always knowing who built the machine and who built the electrical logic.
- **Flexibility** — cross-training means technicians shift toward whichever discipline has demand, instead of sitting idle.

7. Brand Identity & Positioning

Value Proposition

ITS is the single technical partner that keeps industrial equipment running — covering both the electrical and electronic systems and the machines they power, so clients no longer need to manage separate contractors for each.

Suggested Taglines

- "Two Disciplines. One Reliable Partner."
- "Engineering Uptime for Industry."
- "Power. Precision. Performance."

Brand Pillars

- **Dual Expertise** — electrical/electronics and mechanical/machine capability under one roof.
- **Reliability** — consistent, on-time, accountable delivery.
- **Responsiveness** — fast reaction to maintenance and breakdown calls.
- **Safety** — non-negotiable adherence to industrial safety standards.

Visual Identity (Confirmed)

ITS already has a working identity: an angular, forward-leaning mark in signature orange (#FF9F00), paired with the wordmark reading "Industrial Technology Solutions." The sharp diagonal forms read as motion and precision — a strong fit for a technical, industrial brand. Carry this exact orange as the single accent color across documents, the website, and signage, paired with dark charcoal or black for contrast.

Contact Channels

- **Website** — top priority — build and launch first.
- **LinkedIn** — second priority — establish right after the website is live.
- **Phone** — 0699 32 40 76 remains the main business number.

8. Strategic Roadmap

The roadmap below is a founders' working plan, not an investor pitch. Timelines are placeholders — adjust them once you confirm a start date and available capital.

Phase 1 — Foundation (Months 1–3)

- Finalize legal registration and business licensing — done
- Confirm equity split and role ownership among the founders — done
- Set up a workshop/base of operations and core tools and equipment
- Finalize service pricing and standard contract templates — in progress
- Build basic brand assets: logo and business cards — done; website and LinkedIn next
- Identify and approach the first 5–10 target clients

Phase 2 — Early Traction (Months 4–6)

- Deliver the first paid projects across both service lines
- Collect references and short case studies from early clients
- Refine service-delivery process and quality checklists

- Establish supplier and vendor relationships for parts and materials

Phase 3 — Growth (Months 7–12)

- Pursue recurring maintenance contracts for steady revenue
- Add technician capacity as project volume grows
- Pursue relevant safety and quality certifications
- Evaluate expansion into new areas or client segments

Beyond Year 1

- Consider specialization or certification (e.g., automation, specific machine classes)
- Evaluate hiring dedicated admin/finance support
- Revisit pricing and positioning based on real market feedback

9. Immediate Next Steps

- Confirm the final service list and initial pricing — service list updated; final rate figures in progress
- Assign roles among the 2–5 founders — done
- Complete legal business registration — done (sole proprietorship, registered as ITS – Industrial Technology Solutions)
- Set up core brand assets and contact channels — in progress (priority: website, then LinkedIn; phone number confirmed)
- Build a first-outreach target list of 10 prospective clients

See Section 10 for the full client acquisition strategy — direct outreach, proposals, referrals, and network visibility.

This document is meant to be a living reference — revisit and adjust it as ITS moves from planning into operation.

10. Client Acquisition Strategy

Landing the first clients — especially larger industrial manufacturers — calls for precise, high-value conversations rather than mass marketing. The service is critical enough (preventing costly downtime) that a small number of well-targeted relationships will outperform broad advertising.

10.1 Direct Outreach

The highest-impact channel for reaching large industrial manufacturers.

- **Target list** — build a list of Plant Managers, Maintenance Directors, and Operations Managers across the Skikda region.
- **The pitch** — lead with uptime, not repairs.

“I’ve noticed many facilities in our sector face costly delays because they manage electrical and mechanical contractors separately. We eliminate that friction by handling both disciplines under one master-level inspection guarantee.”

- **Log every contact** — track Company Name, Contact Person, Last Contact Date, and Follow-up Status in a simple spreadsheet.

10.2 Professional Proposals

Once a prospect shows interest, the proposal itself needs to separate ITS from cheaper, less professional contractors. Standardize on a clean, branded PDF template covering:

- **The Problem** — state the technical challenge clearly.
- **Your Solution** — briefly explain the technical fix.
- **The Benefit** — lead with ROI — e.g., “this upgrade will reduce unplanned downtime by 15%.”
- **The Master Guarantee** — always close with this as a sign-off to reinforce the quality commitment.

10.3 The Referral Loop

The best source of new clients is the satisfaction of existing ones — build the ask into the natural end of every job.

- **The sign-off trigger** — at hand-over or a maintenance check-in, ask directly rather than just leaving the site.

“I’m glad we could get this system running reliably for you today. Are there any other departments or facilities you manage where we could help improve your uptime?”

- **Incentivize** — after strong work, ask for a direct introduction to another plant manager.

10.4 Visibility via Industrial Networks

- **Be seen** — attend regional industrial events to learn about client problems, not just to sell — trust follows genuine interest.

- **Professional presence** — keep the team in branded gear on-site; the factory floor is the best advertisement.
